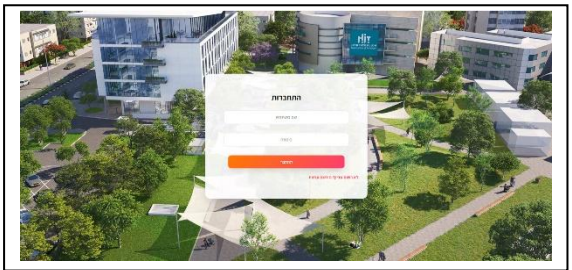
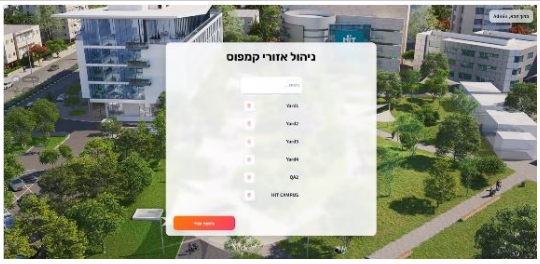
Problem

Campuses lack effective shade management, which in turn causes overheating, discomfort and inefficient use of outdoor areas.

Solution

Optimized web app designed to help users efficiently manage their outdoor spaces and shades.





We designed Shade-System as a responsive web app built with react, giving users access from both desktop and mobile. Data and storage are handled through MySQL, which stores user accounts, campus areas and shade information. This architecture ensures smooth interaction, scalability and reliable management of shaded zones across H.I.T.

- User Information
- Campus Areas Data
- Shade Structures
- Routing & Navigation
- Scalability
- Sign up
- Login
- Interactive Area List
- Edit Area page
- Responsive design

The goal of the project is to develop a versatile web-based system that helps campuses and organizations plan and manage shaded outdoor areas. By providing an interactive tool to upload maps, mark shade structures, and store data, the system aims to improve comfort, optimize shade distribution, and support better decision-making for campus planning teams.

Our web-based platform introduces a new way to plan and oversee shaded spaces on campus. By simplifying the process of mapping areas, adding shade structures, and managing data, the system improves planning efficiency and decision-making. Its true impact depends on successful adoption, which can lead to more comfortable, well-organized, and sustainable outdoor environments.
